

# Chemical reactions

**W**hen we meet someone online we may seem to be completely matched, yet it is not until we meet a date face-to-face that some of us really understands whether there is any kind of genuine possibility of it working out. Having sex previous, This has a lot to do with chemical tendencies, and here i describe some of the scientific disciplines.

## The First Date

First times can be heady experiences since once we go into a new circumstance our body prepares us by issuing a number of chemicals in to the system. For instance, adrenaline is the endocrine which creates the 'fight or flight' response - it increases our heart rate, constricts blood vessels and dilates our air airways. Fight or flight might seem like a strange response to a date but it details well that feeling of being completely alert as well as on shield to respond to a mystery situation.

## The First Hug

When we make physical make contact with an additional set of chemicals is needed. They are classified as **pheromones** and make us all smell attractive to the partner. Pheromones are freed naturally simply by the body and different people launch different levels. The particular perfume market has tried to be able to profit from this kind of science for decades by producing perfumes which closely appear like **human pheromones**.

## Subsequent Dates

The first phase of a relationship can feel very intense and for a lot of chemicals race close to your brain and also body when you are falling in love. That initial flush produces a racing cardiovascular, flushed skin as well as sweaty hands. This is due to the dopamine, norepinephrine and phenylethylamine being released in our bodies.

*“ Dopamine is thought to be the 'pleasure chemical', creating a feeling of satisfaction and norepinephrine is similar to adrenaline and produces the racing cardiovascular and feelings of excitement. When combined these two chemical compounds create fulfillment, intense energy, sleeplessness, craving, loss of appetite and focused attention.*

- Couples with this stage of love often appear obsessed with each other.
- This is because they have lower levels of this and also the neural circuits associated with the way we determine others are suppressed.

## Making Love Last

All of these chemical responses reduce with time, when what we call the 'honeymoon period' passes. Unfortunately, they can occur with those people who are totally unsuitable - which is why we're not always the best judges of character inside the very first eliminate of romance!

My advice is not to put too much pressure on yourself and not to be too eager to move a new relationship rapidly on to the next stage. Matches made taking into consideration the seven defects of assortment - including items like character imperfections and shared experiences - are more likely to last when the chemical reactions settle down. That way, you will end up with a real and true love that has the best possible chance of succeeding.
